Awareness and usage pattern of library resources and services by the users of the Maulana Azad Library, AMU Aligarh: An analytical study

Nazia Salauddin
Integral University, India

Abstract

This study explores the awareness and usage patterns of library resources and services among users of the Maulana Azad Library at Aligarh Muslim University (AMU). A survey methodology was employed, with 220 questionnaires distributed to library users, including undergraduate, postgraduate, research scholars, and faculty members. A total of 180 responses were received, resulting in an 81.81% response rate. The study found that a significant number of users visit the library primarily to borrow or return books, with books and journals being the most frequently utilized information sources. Most users are aware of copyright laws and regulations. However, many users lack familiarity with information literacy skills and techniques, leading to varied levels of awareness regarding library resources and services. While users expressed general satisfaction with the library's offerings, they suggested improvements, such as increasing access to electronic resources and extending library operating hours. The study further identifies factors influencing user awareness and usage, including academic discipline, research interests, and study habits. Based on these findings, the study recommends strategies to enhance library services, including improving user awareness, offering more user-friendly services, and providing continuous training and support to better meet the needs of library users.

Keywords

library services and resources, information literacy, quality services, Aligarh Muslim University, user rights

Submitted: 13 June 2024; accepted: 17 December 2024

1. Introduction

Libraries have long been recognized as essential pillars of academic institutions, serving as repositories of knowledge, and providing access to a wealth of resources and services to support the learning, teaching, and research endeavors of students, faculty, and researchers. In the era of information explosion, where the sheer volume of information available can be overwhelming, libraries play a crucial role in helping users navigate this complex landscape and find the information they need. University libraries play a vital role in providing access to information resources and services for students, faculty, and researchers. Understanding the awareness and usage patterns of library resources and services among these users is crucial for improving library services and ensuring that they meet the evolving needs of the user community. This study aims to assess the level of awareness of library resources and services among users of the university library system, analyze the usage patterns of library resources and services among different user groups, identify factors that influence the awareness and usage of library resources and services, and provide recommendations for enhancing the awareness and usage of library resources and services. The study intends to identify factors that influence the awareness and usage of library resources and

Corresponding author:
Nazia Salauddin, Library Services, Integral University, Lucknow, India.
Email: nazia2710@gmail.com

services. These factors could include demographic characteristics like age, gender, or educational background, as well as external factors like accessibility, convenience, or perceived value of the resources and services. By identifying these factors, the study can provide insights into why some users may be more aware and utilize library resources and services more than others. This study holds relevance not only for the local context but also contributes to the broader discourse on the evolving role of libraries in the digital age. It is through a nuanced understanding of awareness and usage patterns that libraries can continue to evolve as vibrant hubs of learning and scholarship, catering effectively to the diverse needs of their users. This research delves into the intricacies of how users at Maulana Azad Library perceive and engage with its vast array of resources and services. The crux lies not only in the abundance of materials available but also in the ability of users to navigate this treasure trove effectively. Awareness becomes the first step towards unlocking the potential of a library's offerings, while usage patterns provide valuable insights into the impact of these resources on the academic pursuits of the community.

1.1. Maulana Azad Library, Aligarh Muslim University (AMU)

Aligarh Muslim University (AMU) is a public central university in Aligarh, Uttar Pradesh, India. It was originally established as the Muhammadan Anglo-Oriental College in 1875. The university has a long and distinguished history, and it has produced some of India's most notable leaders, scholars, and scientists. AMU is a multidisciplinary university with a wide range of academic programs. It offers undergraduate and postgraduate programs in a variety of fields, including arts, sciences, engineering, medicine, and law. The university is also home to several research institutes and centers. AMU has a strong commitment to research and innovation. The university has been ranked among the top universities in India for research output. AMU is also a leader in the development of new technologies, and it has several patents to its name. AMU is a diverse and inclusive university. The university welcomes students from all over India and the world. AMU is also committed to providing a safe and supportive environment for all its students.

The Maulana Azad Library is the central library of Aligarh Muslim University (AMU) in Aligarh, India. It is the largest university library in Asia and a treasure trove of knowledge for students, researchers, and scholars. The library was established in 1960 and was named after Maulana Abul Kalam Azad, a renowned scholar, educationist, statesman, freedom fighter, and the first Education Minister of India. The seven-story building of the library is designed in a modern style with a spacious and airy interior. The building is surrounded by 4.75 acres of lawns and gardens, creating a peaceful and serene environment for learning and research. The library houses a vast collection of over 1.5 million books, journals, manuscripts, maps, and other resources. It also has a rich collection of rare books and manuscripts, including some dating back to the sixteenth century. The Maulana Azad Library has played a vital role in the academic and intellectual development of Aligarh Muslim University. It is a major resource for students and researchers from all over the world and is recognized as one of the leading university libraries in India. Maulana Azad Library has a chain of resources where maximum information assessment tools are available. Despite the invaluable role libraries play in the academic ecosystem, concerns persist regarding the level of awareness and utilization of library resources and services among users. Studies have shown that a significant portion of library users may not be fully aware of the breadth and depth of resources available to them, leading to underutilization of these valuable assets. Understanding the factors that influence user awareness and usage patterns is crucial for libraries to effectively tailor their services and maximize their impact on the academic community.

2. Review of literature

University libraries are increasingly essential in supporting academic and research activities, especially in an age of digital transformation and information overload. Recent studies underscore the evolving role of libraries in offering digital resources and services that support students and researchers effectively. For instance, a study (Atuase and Filson, 2024) investigates the availability and accessibility of academic library resources for prison inmates in a distance education program, finding that current prison library resources do not adequately support inmates' learning needs and suggesting collaboration with academic libraries to improve services. (Ahmed, et al. 2024) study compares how libraries in Bangladesh and Malaysia adapted to COVID-19, focusing on online service delivery and remote work. Libraries used

social media and revamped websites to stay connected, underscoring their essential role in community support during closures. Sujood et al. (2023) highlights how university libraries adapted to user needs post-COVID-19 by expanding digital access and online support services, which improved user satisfaction and engagement. Similarly, research by Khan et al. (2023) emphasizes that modern libraries must continue updating their technological infrastructure to meet the rising demand for digital resources, particularly among research scholars. (Fauziyyah et al., 2023) With the advent of the digital era the accessibility of library resources has become reachable to users, Users can now access library collections online from anywhere at any time. (Kumar and Gupta, 2022) study demonstrates that users' usage and preference for e-resources and e-services have on the raised, leading to a trend of overlooking traditional print resources when electronic options are available (Yi, et al., 2022) provides strong evidence that provides access to a wide range of resources, expert assistance, and a conducive learning environment. (Yang et al., 2021) results show a valuable contribution to our understanding of the effects of remote work on collaboration and considered by resources that have implemented or expanded remote work programs. (Gómez-Cruz, et al., 2020) shows that assessment is crucial for libraries to ensure quality services, and researchers have recognized the importance of service quality in modern economies (Chanchinmawia and Verma, 2018) findings should be considered by librarians, educators, and policymakers as they develop and implement information literacy programs for research scholars. (Kamau, 2018) explores copyright challenges in digital libraries, focusing on Kenya, covering issues like digitization permissions, Digital Rights Management, and access limitations for visually impaired users. The author suggests enhancing copyright education, updating laws, and promoting open access to balance copyright restrictions and user access. (Mallya and Patwardhan, 2018) valuable contribution to the literature on hospitality students' satisfaction with library services. The study's findings should be considered by librarians, educators, and policymakers as they develop and implement library services for hospitality students. (Delaney and Bates, 2015) valuable contribution to the literature on faculty-librarian partnerships also provides a clear and concise framework for building information providers for library users. (Khaola, 2015) found that there were some challenges associated with implementing blended learning in Saudi Arabia. The teachers reported that they needed more training and support in using learning technologies, and the students reported that they sometimes had difficulty accessing the online resources. (Delaney and Bates, 2015)The authors argue that academic libraries need to adapt to the changing needs of their users in order to remain relevant and valuable partners in the teaching and learning process. (Ahmad, et al., 2023) to measure the acceptance of digital resources by integrating knowledge management factors, into the factors of the technology acceptance model. (Ahmad, 2017) they articulated that knowledge management practices were essential for the improvement of their respective library service. (Salauddin & Kumar, 2020) Library services and resources define the library's strength and quality parameters must be inculcated with them. (Alabiet al., 2023) They focused on academic libraries recognizing this challenge and providing specialized information services, to help users develop the skills and knowledge needed to navigate the information maze and find the information they require. (Barfi et al., 2023) suggests that social influence plays a significant role in shaping students' attitudes and behaviors toward utilizing the e-library and support services, they are more likely to follow suit and engage with the e-library and support services themselves.

Despite these advancements, gaps persist in understanding user awareness and usage patterns for digital and traditional library resources. Many studies, including one by Alabi et al. (2023), show that a considerable proportion of users are still unaware of the full range of available resources, especially e-resources, which leads to underutilization. Furthermore, limited research explores the distinct needs and usage behaviors of different academic groups within the same library setting, such as undergraduates versus research scholars, highlighting the necessity of examining diverse user perspectives.

This study aims to address these gaps by analyzing user awareness and utilization patterns of both physical and digital resources at the Maulana Azad Library. By identifying specific barriers, such as varying information literacy skills and access challenges, this research contributes to the ongoing discourse on optimizing library services in a rapidly changing academic landscape.

3. Several contemporary challenges underscore the importance of this study

In the rapidly evolving landscape of academic libraries, understanding user awareness and usage patterns of library resources and services is crucial. This study investigates the current state of resource utilization and user satisfaction at the Maulana Azad Library,

AMU Aligarh, providing essential insights for strategic planning and service enhancement.

Staffing Challenges: Academic libraries, including the Maulana Azad Library, face significant staffing challenges due to budget cuts, retirements, and the need for specialized skills in digital librarianship. This study's insights into user needs and behavior can help optimize staff deployment, ensuring that human resources are utilized efficiently and effectively.

Facilities Stress: With rising student enrollments and the growing demand for both physical and digital study spaces, library facilities are under considerable stress. The findings of this study highlight how users interact with different resources and spaces, providing data-driven guidance for renovations and expansions that better meet user needs.

Resource Allocation: Libraries are grappling with budget constraints while striving to expand their collections and digital resources. This study's analysis of usage patterns offers valuable data that can inform resource allocation decisions, ensuring that the most utilized and needed resources are prioritized.

Digital Transformation: The COVID-19 pandemic has accelerated the shift towards digital resources and services, fundamentally changing how users engage with libraries. This study sheds light on current digital resource usage and user preferences, informing strategies to enhance digital service delivery and improve user satisfaction.

By addressing these critical factors, this study not only contributes to the academic understanding of library usage patterns but also provides practical recommendations for library management at the Maulana Azad Library and other similar institutions facing these contemporary challenges.

4. Objectives of the study

This study examines the awareness and usage patterns of library resources and services among users of the Maulana Azad Library at Aligarh Muslim University (AMU), Aligarh. Specifically, the study aims to:

1. Assess the Awareness Level, evaluate how well users are aware of the available library resources and services at the Maulana Azad Library.
2. Identify Usage Patterns, determine which library resources and services are most frequently used by users, highlighting preferences and trends in resource utilization.
3. Analyze Influencing Factors, investigate the factors impacting resource usage patterns, including user demographics, academic background, and proficiency with technology.

5. Methodology of the study

This study employs a quantitative research design to examine the awareness and usage patterns of Maulana Azad Library resources among Aligarh Muslim University (AMU) users. Utilizing a survey method, a structured questionnaire was administered to a simple random sample of 220 library users across four AMU faculties: Arts and Social Sciences, Sciences, Management Studies, and Engineering & Technology. From these, 180 complete responses were included in the analysis. The survey instrument was meticulously developed to capture essential variables such as demographics, awareness levels, usage patterns, encountered challenges, and user suggestions. Pre-testing the questionnaire helped enhance clarity and reliability, and ethical standards were upheld, with participants informed of confidentiality assurances. Descriptive statistics, including frequency distributions, means, and standard deviations, were used to organize and summarize the data, while inferential statistics, like chi-square tests, identified significant relationships. A significant level of 0.05 was maintained to ensure robust and reliable findings, minimizing the risk of false positives and providing valuable insights into potential improvements in library services. (Mansoor et al., 2022) The survey research can be more elaborate on the user's assessment parameter. The sample random technique involves a subset of individuals randomly selected by researchers to represent an entire group. Data Analysis techniques used for Descriptive statistics, including frequency distributions, means, and standard deviations, have been employed to summarize and organize the quantitative data. Inferential statistics, such as chi-square tests have been utilized to test categorical data about the relationships between variables and identify statistically significant patterns.

6. Data analysis and interpretations

After gathering the data, the following phase is the analysis and interpretation of the data. The data collected was carefully and thoroughly analyzed using the basic percentage technique, and the results were calculated. The data has been presented in tabular formats representations to the university user's participants in this survey. This below table shows the number of category wise students at Aligarh Muslim

University (AMU). The total number of students is 180 of these students, 99 are male (55.3%) and 81 are female (44.7%).

Calculated the value of χ^2 was observed to be 29.94, and the p-value was 0.000 which is less than 0.05, meaning that the proportions of the respondents of different user's category differ significantly.

The Table 1 shows the number of library users at Aligarh Muslim University (AMU) by user category, the percentage of the total number of users that each category represents, the mean library usage score for each category, and the standard deviation of the library usage score for each category. Undergraduate: 33.0% of the library users at AMU are undergraduates. The mean library usage score for undergraduates is 1.4407, with a standard deviation of .50073. Postgraduate: 34.1% of the library users at AMU are postgraduates. The mean library usage score for postgraduates is 1.7049, with a standard deviation of .45986. Research Scholars: 22.3% of the library users at AMU are research scholars. The mean library usage score for research scholars is 1.1750, with a standard deviation of .38481. Faculty: 10.6% of the library users at AMU are faculty. The mean library usage score for faculty is 1.2105, with a standard deviation of .41885.

Calculated the value of χ^2 was observed to be 48.84, which means that there is a very strong association between the two variables. The p-value of less than 0.0001 means that this association is statistically significant. This means that there is a significant difference in the frequency of library visits between different disciplines.

Based on data Table 2, many users visit the library twice a week (44.4%). The next most frequent frequency is daily visits (45.6%). Undergraduate students are the most frequent users of the library, followed by postgraduate students and research scholars. Faculty members are the least frequent users of the library.

Faculty of Arts and Social Sciences: Undergraduate students visit the library daily (16.7%), postgraduate students visit the library daily (.6%), and research scholars visit the library daily (8.9%).

Faculty of Sciences: Undergraduate students visit the library twice in a week (4.4%), postgraduate students visit the library daily (3.9%) or twice in a week (12.8%), research scholars visit the library daily (.6%) or twice in a week (2.2%), and faculty members visit the library occasionally (6.1%). Faculty of Management Studies: Undergraduate students visit the library daily (2.8%) or twice in a week (3.9%), postgraduate students visit the library daily (3.3%) or twice in a week (5.0%), research scholars visit the library daily (1.7%) or twice in a week (4.4%), and faculty members visit the library occasionally (2.2%).

Faculty of Engineering and Technology: Undergraduate students visit the library daily (2.8%) or twice in a week (1.1%), postgraduate students visit the library daily (1.7%) or twice in a week (3.9%), research scholars visit the library daily (.6%) or twice in a week (2.2%), and faculty members visit the library twice in a week (.6%), twice in a month (.6%), or occasionally (1.1%).

Overall, the library is being used by a wide range of users from a variety of disciplines. The library should continue to provide a variety of resources and services to meet the needs of all its users.

Calculated the value of χ^2 was observed to be 17.94, and the p-value was 0.0004 which is less than 0.05, which means that there is a significant association between the two variables. The p-value of 0.0004 means that this association is statistically significant. This means that there is a significant difference in the purpose of library visits between different categories of users.

Table 3 shows the frequency and mean number of visits to the library for different purposes. The data is broken down by category: undergraduate, postgraduate, research scholar, and faculty. The most common purpose for visiting the library is to borrow or return books. This is especially true for undergraduate students, with 17.2% of their visits devoted to this purpose. Postgraduate students and research scholars also visit the library frequently to borrow or return books, with 7.2% and 4.4% of their visits, respectively, dedicated to this task. Consulting reference material is another common purpose for visiting the library. Postgraduate students are the most likely to visit the library for this purpose, with 16.7% of their

reading journals or magazines. Undergraduate students are the most likely to visit the library to read newspapers, with 3.3% of their visits dedicated to this activity. Postgraduate students and research scholars are less likely to visit the library for this purpose, with only 0.6% and 0.6% of their visits, respectively, devoted to reading newspapers. Accessing online resources is another common purpose for visiting the library. Research scholars are the most likely to visit the library for this purpose, with 3.9% of their visits dedicated to accessing online resources. Postgraduate students are also relatively likely to visit the library for this purpose, with 2.8% of their visits devoted to accessing online resources. Undergraduate students are the least likely to visit the library for this purpose, with only 2.8% of their visits dedicated to accessing online resources. Postgraduate students are the most likely to visit the library to study in the peaceful academic environment, with 6.7% of their visits dedicated to this activity. Research scholars and undergraduate students are also relatively likely to visit the library for this purpose, with 3.3% and 2.2% of their visits, respectively, devoted to studying in a peaceful academic environment. The library is being used for a variety of purposes by students, faculty, and researchers. The most common purposes are to borrow or return books, consult reference material, and access online resources. The library should continue to provide a variety of resources and services to meet the needs of all its users.

Calculated the value of χ^2 was observed to be 40.99, and the p-value was $p < 0.001$which is less than 0.05, there is a significant association between the category of user and the source consulted to find a book.

Table 4 represents the consultation of information sources to find books. The undergraduate users 31 (17.2%) search book from library catalog followed by 14 (7.8%) users need to find information with library staff, 7 (3.9%) users need the information to find the books with friends' consultation, 4 (2%) users search information racks personally and OPAC search too. Post Graduate users 30 (16.7%) find a book from search rack personally followed by 18 (10%) find from the library catalog, 8 (4.4%) users find a book from OPAC search, and 5 (2.8%) find a book from friend assistance. The research scholar 21 (11.7%) access information from personally in rack followed by 15 8.3% access information from the library catalog, 2 (1.1%) search information from friend assistance and 1 (0.06%) search information from library staff and OPAC. The faculty 8 (4.4%) search for books from personally in racks followed

	For research work	9	5.0%	2.7778	.83333
Total		180	100.00%	30.0185	10.8279

$\chi^2 = 42.22$ d.f. = 12 P = < 0.0001.

by 3 (1.7%) search books from the library catalog, assistance by library staff and friends, and 2 (1.1%) from OPAC.

Calculated the value of χ^2 was observed to be 42.22, the chi-square statistic of 42.22 is very high, which means that there is a very strong association between the two variables. The p-value of less than 0.0001 means that this association is statistically significant. This means that there is a significant difference in the information needs of users between different categories of users.

Table 5 shows the information needs of undergraduate, postgraduate, research scholars, and faculty. The most common information needed for all categories

Table 6. Search information in the library catalogue OPAC.

Search in Library Catalogue	Category	N	% of Total Sum	Mean	Std. Deviation
By title	Undergraduate	22	9.6%	1.9091	1.15095
	Postgraduate	33	20.6%	2.7273	1.03901
	Research Scholars	6	1.8%	1.3333	.81650
	Faculty	4	2.5%	2.7500	.50000

$\chi^2 = 18.98$ d.f. = 9 P = < 0.0001.

of users is to update subject knowledge. This is followed by preparing assignments and doing research work. Other reasons for visiting the library include seeking general knowledge, reading newspapers and magazines, and using the internet. Undergraduate students are the most likely to visit the library to update their subject knowledge and prepare assignments. Postgraduate students are the most likely to visit the library to do research work. Research scholars are the most likely to visit the library to update subject knowledge and prepare assignments. Faculty members are the most likely to visit the library to do research work. Overall, this table provides a useful overview of the information needs of different categories of users. This information can be used to improve library services and make sure that the library is meeting the needs of its users.

The table shows a comprehensive overview of the diverse information needs of library users across different categories. This information can serve as a foundation for strategic planning, allowing the library to align its resources and services with the specific needs of each user category. Ultimately, understanding user information needs contributes to the effectiveness of the library in supporting academic and research endeavors.

The library catalog is an extremely valuable tool for locating library materials. It makes it easier for users to identify and locate a book in a collection. The study aimed to determine respondents' capability to navigate the library catalog to locate and discover the document they were looking for. The interpretations are summarized in the table that follows.

Calculated the value of χ^2 was observed to be 18.98, and the p-value was $p < 0.0001$ which is less than 0.05, This indicates that there is a statistically significant association between the category of search requests and the author type.

Table 6 summarizes the search methods used by different categories of library users to find materials. The most common search method for all categories of users is by title, followed by searching by author, subject, and publisher. The table also shows the mean and standard deviation of the number of times each search method was used. It is essential to examine the respondents' search strategy to seek a book in a library catalog. How to assess them they proficient in using the catalog. Table 8 depicts that the Postgraduate users 33(20.6%) search by title followed by undergraduate 22 (9.6%), research scholars 6(1.8%), and faculty 4(2.5%). The research scholar 20(13.8%) search by the author followed by postgraduate 12(9.6%), faculty 7(3.7%), and undergraduate 3 (1.4%). The undergraduate 27(14.2%) search by the subject followed by the research scholars 12 (3.7%), postgraduate 11(6%), and faculty 3 (2.1%). The research scholar 8(3.4%) search information by the publisher followed by the postgraduate & faculty both 5(3%) and undergraduate 2(1.4%).

Reference materials are the most asset in the library. They keep the various information demands

Table 7. Uses of sources to learn about the history of a subject.

Sources Consult to Find the Background Information of Subject	Category	N	% of Total Sum	Mean	Std. Deviation
Book	Undergraduate	43	21.8%	2.2093	1.33734
	Postgraduates	21	12.2%	2.5238	.81358

Total		180	100.00%	46.2331	16.51731

$\chi^2 = 36.27$ d.f. = 12 P = < 0.0001.

of users up to date and accurate. (Oak, 2016) quality service enhanced the user availability in the library. An encyclopedia is one of the reference materials that can be used to learn about a subject or a topic from the beginning and provide background information. Respondents were asked to identify the best source for background information on the issue to assess their information using an encyclopedia. The purpose of this exercise must determine their awareness of the use of sources of information and other reference sources.

Calculated the value of χ^2 was observed to be 36.27, and the p-value was $p < 0.0001$ which is less than 0.05, This indicates that there is a statistically significant association between the category of search requests and the source consulted to find background information.

Table 7 presents the various sources consulted by undergraduates, postgraduates, research scholars, and faculty to find background information on a subject. The table shows the number of times each source was consulted by each category of user, as well as the percentage of total consultations for each source. The mean and standard deviation of the number of times each source was consulted are also shown.

Table demonstrates the undergraduate users, 43(21.8%) believe that books are an excellent information source to gain information for a subject followed by postgraduate 21(12.2%), research scholars 12(4.1%), and faculty 3 (1.6%). The postgraduate 13(7.1%) and research scholars 12(7.8%) chose the journal, followed by undergraduate 8 (3.7%), and faculty 8 (3%). The research scholar faculty and undergraduate chose the encyclopedia to gain familiarity with the subject. The postgraduate users, 21(15.4%), opt for the databases for searching the information about the subject followed by Research scholar 8 (5.3%) and faculty 8 (5.3%). The online tutorial plays a vital role in keeping subject knowledge up to date; the postgraduate 6 (4.6%) use online tutorial tools followed by research scholars and faculty. The table shows that books are the most common source of background information for all categories of users, followed by databases and journals. Encyclopedias and online tutorials are consulted less frequently. The table also shows that research scholars tend to consult a wider range of sources than undergraduate and postgraduate students. The table provides useful information for librarians and other educators on how to provide students with the resources they need to find background information on a subject.

The user's daily information requirements necessitated the provision of current information to them. To determine users, have a complete understanding of the

Table 8. Current information for work.

Recent Information for Work	Category	N	% of Total Sum	Mean	Std. Deviation
Book	Undergraduate	20	13.8%	1.7000	1.12858
	Postgraduate	21	14.9%	3.0952	1.04426
	Research Scholars	21	7.8%	1.6190	1.20317
	Faculty	1	0.9%	4.0000	.

	Faculty	5	3.4%	3.0000	1.00000
Online tutorials	Research Scholars	1	0.2%	1.0000	.
	Faculty	1	0.5%	2.0000	.
Total		180	100.00%	40.832	11.0869

$\chi^2 = 20.49$ d.f. = 9 P = < 0.0001.

source of recent information, they were asked to identify the best source for obtaining current information, and the responses were analyzed as follows.

Calculated the value of χ^2 was observed to be 20.49, and the p-value was $p < 0.0001$ which is less than 0.05, This indicates that there is a statistically significant association between the category of search requests and the source consulted for recent information.

Table 8 shows the frequency of different types of recent information sources used by undergraduates, postgraduates, research scholars, and faculty for work. The most common type of source is books, followed by journals and encyclopedias. Databases and online tutorials are used less frequently.

Table articulated that postgraduate 21(14.9%) and Research scholar 21 (14.9%) students utilized books to get the most up-to-date knowledge on the subject, followed by undergraduate 20(13.8%) and faculty 1(0.9%). The Postgraduate students, 26 (15.1%) adopted journals to obtain up-to-date information, followed by undergraduate 20(13.8%), faculty 10(5.8%), and research scholar (5%). The undergraduate 20(13%) use an encyclopedia to get the latest information, followed by faculty and research scholars. The postgraduate 14(9.2%) used the database to acquire the up-to-date information, followed by faculty and research scholars. An online tutorial is also necessary to access the most recent material. Undergraduate students are most likely to use books and journals for recent information followed by Postgraduate students are more likely to use a wider variety of sources, including databases and online tutorials, Research scholars are most likely to use encyclopedias and Faculty members are most likely to use journals.

This information can be used to improve the provision of information and resources to users by providing more training on different types of sources, making sure that the library has a good selection of recent materials, and stocking the library with materials that are in high demand.

Calculated the value of χ^2 was observed to be 19.46, and the p-value was $p < 0.0001$ which is less than 0.05, This indicates that there is a statistically significant association between the category of respondents and their knowledge about copyright laws.

Table 9 illustrates the users' awareness and understanding of the copyright law regulations. Surprisingly, 80% of users are aware of copyright rules and regulations, which is surprising considering that just 20% are unfamiliar with copyright laws and regulations. The Postgraduate 53(29.4%) users know about the copyright law, followed by undergraduate 39(21.7%), research scholars 34(18.9%), and faculty 19(10.6%).

Overall, 80.6% of respondents reported having knowledge of copyright laws. Besides this, the postgraduate students had the highest average level of knowledge, followed by faculty members, research scholars, and undergraduate students. The standard

Table 9. Awareness of the copyright law regulations.

Knowledge about the Copyright Laws	Category	N	% of Total N	Mean	Std. Deviation
Yes	Undergraduate	39	21.7%	2.2821	1.21284

Table 10. Ability to evaluate sources of information.

Ability to Evaluate Sources of Information	Category	N	% of Total N	Mean	Std. Deviation
Date of publication	Undergraduate	12	6.7%	1.1667	.38925
	Postgraduate	14	7.8%	1.1429	.36314
	Research Scholars	21	11.7%	1.0952	.30079
	Faculty	3	1.7%	1.6667	.57735
Author is known in the area	Undergraduate	34	19.0%	1.5294	.50664
	Postgraduate	42	23.5%	1.9762	.15430
	Research Scholars	16	8.9%	1.3125	.47871
	Faculty	7	3.9%	1.1429	.37796
Available information is accurate	Undergraduate	13	7.3%	1.4615	.51887
	Postgraduate	4	2.2%	1.0000	.00000
	Research Scholars	6	3.4%	1.0000	.00000
	Faculty	7	3.9%	1.1429	.37796
Total		180	100.00%	15.6369	4.04497

$\chi^2 = 22.61$ d.f. = 9 P = < 0.0001.

deviation of the knowledge level was relatively high for all categories of respondents, indicating a wide range of knowledge levels within each group.

It was inquired which parameter respondents used to assess information sources to measure their capacity to analyze information sources. The findings were used to evaluate the capability.

Calculated the value of χ^2 was observed to be 22.61, and the p-value was $p < 0.0001$ which is less than 0.05, This indicates that there is a statistically significant association between the category of respondents and their ability to evaluate sources of information.

Table 10 demonstrates each category of users about the evaluation of information sources, Undergraduate got a mean score is 1.1667 with a standard deviation of 0.38925, indicating a moderate ability to consider the publication date while Postgraduate slightly higher mean of 1.1429 suggests a similar level of consideration for publication dates. Research scholars got a mean of 1.0952, and research scholars demonstrated a lower emphasis on the date of publication compared to other groups while Faculty members showed a higher mean of 1.6667, suggesting a stronger emphasis on the recency of sources. The author is Known in the Particular Area results show the Undergraduate mean score is 1.5294, indicating a relatively strong consideration for authors known in the field while Postgraduates got a higher mean of 1.9762 suggesting a more discerning approach, emphasizing familiarity with authors. Research Scholars got a mean of 1.3125, research scholars show a moderate consideration for the author's reputation while Faculty members demonstrate the lowest mean of 1.1429, indicating a lesser emphasis on the author's familiarity. Available Information is Accurate results show Undergraduate The mean score is 1.4615, suggesting a moderate emphasis on the accuracy of

Table 11. Constraints while seeking information by users.

Problems Face by the Respondents while Seeking Information	Category	N	% of Total N	Mean	Std. Deviation
Lack of information searching skills	Undergraduate	17	9.5%	2.0000	.00000
	Postgraduate	2	1.1%	1.5000	.70711
	Research Scholars	11	6.1%	1.0909	.30151
	Faculty	3	1.7%	1.3333	.57735
Lots of information available	Undergraduate	18	10.1%	1.0556	.23570
	Postgraduate	41	22.9%	1.9756	.15617
	Research Scholars	18	10.1%	1.2778	.46089
	Faculty	8	4.5%	1.2500	.46291
Don't know how to use e-resources	Research Scholars	1	0.6%	1.0000	.
	Faculty	1	0.6%	1.0000	.
Lack of awareness about information resources	Undergraduate	5	2.8%	1.6000	.54772
	Postgraduate	16	8.9%	1.1250	.34157
	Research Scholars	10	5.6%	1.1000	.31623
	Faculty	2	1.1%	1.0000	.00000
No problem	Undergraduate	17	9.4.6%	1.2632	.45241
	Postgraduate	2	1.2	1.0000	.00000
	Postgraduate	2	1.1%	1.0000	.00000
	Faculty	5	2.8%	1.2000	.44721
Total		180	100%	21.7714	5.00678

$\chi^2 = 24.61$ d.f. = 12 P = < 0.0001.

information while Postgraduate A perfect mean score of 1.0000 indicates a strong emphasis on accuracy among postgraduate students. Similar to postgraduates, research scholars also prioritize accuracy, reflected in a mean score of 1.0000. Faculty members, with a mean of 1.1429, demonstrate a moderate consideration for the accuracy of information.

This table shows the most common problems faced by undergraduates, postgraduates, research scholars, and faculty members while seeking information. The most common problem for all categories of users is "lots of information available," followed by "lack of information searching skills" and "lack of awareness about information resources."

Calculated the value of χ^2 was observed to be 24.61, and the p-value was $p < 0.001$ which is less than 0.05, This indicates that there is a statistically significant association between the category of respondents and the problems they face while seeking information.

The analysis Table 11 illustrates that most of the postgraduate (22.9%) believe that having a lot of information available creates limits in its usage, followed by research scholars and undergraduate 18 (10.1%). The Undergraduate users 17(9.5%) states that the lack of information searching skills followed by research scholars 11(6.1%), postgraduate and faculty, similarly the result found the lack of information about the sources is of the problem persistence by the users. Besides this, undergraduate 19(10.6%) have no problem searching information resources, followed by faculty 5(2.8%) and postgraduate 2(1.1%). A very small number of users believe they do not understand using e-resources.

Undergraduate students are most likely to report having problems with "lots of information available" and "lack of information searching skills." Similarity Postgraduate students are more likely to report having problems with all four of the listed problems. Research scholars are most likely to report having problems with "lots of information available" and "lack of awareness about information resources. "Similarly, Faculty members are least likely to report having problems with any of the listed problems.

Respondents were asked about the importance of information literacy programs, and the responses obtained are summarized in the following table 12.

Calculated the value of χ^2 was observed to be 16.99, and the p-value was $p < 0.0001$ which is less than 0.05, This indicates that there is a statistically significant association between the category of respondents and their opinions on the need for information literacy programs. Table 12 represent the information literacy must be required to design an Instruments Bridge between the users and the library. The program design must specify how to overcome the

Table 12. Need for an information literacy program.

Total		180	100%	29.1153	5.73634

$\chi^2 = 33.59$ d.f. = 12 P = < 0.0001.

challenges that the users are experiencing. The need for and importance of the information literacy program of the respondents can be observed from Table 13. Overall, 81.6% of respondents agreed that there is a need for information literacy programs. Postgraduate students had the highest average level of agreement, followed by faculty members, undergraduate students, and research scholars. The standard deviation of the need level was relatively high for all categories of respondents, indicating a wide range of opinions within each group. Undergraduate students were more likely to have a neutral opinion about the need for information literacy programs than postgraduate students or research scholars. Faculty members had the highest

percentage of respondents who strongly agreed that there is a need for information literacy programs.

It is necessary to understand the importance of information literacy programs; it has a vast scope; every area demands some instruction. We need to understand the users' requirements and implement them.

Calculated the value of χ^2 was observed to be 33.59, and the p-value was $p < 0.0001$ which is less than 0.05, This indicates that there is a statistically significant association between the category of respondents and their beliefs about the areas where information literacy programs are required.

Table 13 depicts that undergraduate 26(14.5%) required a training plan to utilize the library resources, followed by postgraduate 15(8.4%), research scholars, and faculty 9 (5%). About the postgraduate 20(11.2%) required to the train session for the use of e-resources followed by undergraduate 15(8.4%) and research scholars 14 (7.8%). The undergraduate 10 (5.6%) and postgraduate 10(5.6%) majority of all categories need to train for online reference tools. The research scholars 14 (7.8%) need assistance to train on formulating search strategies followed by postgraduate and faculty. There were substantially fewer users who required training to utilize the OPAC and the internet, the level of training was significantly lower.

The most common areas where respondents believe there is a need for information literacy programs are use of library resources, use of e-resources, and formulating search strategies. Undergraduate students are most likely to need help with using library resources and e-resources, while postgraduate students are most likely to need help with formulating search strategies. Research scholars are most likely to need help with formulating search strategies and online reference tools. Faculty members are most likely to need help with using e-resources and online reference tools.

7. Discussion and suggestions

The findings of this study align with the broader trends identified in literature, highlighting the critical role of university libraries in adapting to technological changes and meeting the diverse needs of their users. While the study found that most users were aware of the library's resources and services, there was notable variation in awareness levels among different user groups. Some users showed higher awareness of certain resources and services, while others were less informed. This variation may reflect differences in user engagement, accessibility to information, and the effectiveness of communication strategies employed by the library. As seen in the work of Sujood et al. (2023) and Khan et al. (2023), expanding digital access and providing online support services are essential strategies that have contributed to improved user satisfaction and engagement. In this context, the study's findings emphasize the need for the library to enhance communication and outreach efforts, particularly to less engaged groups.

One key area identified in the study is the general satisfaction users expressed regarding the library's resources and services. However, users highlighted that there were opportunities for improvement, particularly in expanding digital resources and services. Studies such as Kumar and Gupta (2022) and Fauziyyah et al. (2023) stress the importance of increasing the availability of electronic resources, such as e-books, e-journals, and databases, as these resources are increasingly preferred by users over traditional print materials. To remain relevant and meet user demands, libraries should continue to expand their digital collections and invest in new technologies. This would involve not only purchasing more resources and subscribing to additional databases but also ensuring the accessibility of these resources across various platforms and devices.

The study also points to the need for the library to extend its operating hours, particularly to accommodate students who require access to resources during evenings and weekends. This suggestion is in line with the recommendations of Ahmed et al. (2024), who found that libraries adapted to remote work and extended their digital services during the COVID-19 pandemic. In the post-pandemic era, offering 24-h access, particularly to students living on campus, can significantly enhance the library's accessibility and usability, fostering a more inclusive learning environment. The expansion of operating hours should be complemented by the development of additional support services, such as online assistance, to address the needs of users who may have limited time to visit the library in person.

Training in information literacy is another area highlighted by the study. While users expressed general satisfaction with library services, many felt they lacked the skills to effectively search for and evaluate information. This finding echoes the concerns raised by Chanchinmawia and Verma (2018) regarding the importance of information literacy programs for research scholars. To address this gap, the library should implement comprehensive information

literacy programs, focusing on teaching students how to search for information effectively, evaluate sources critically, and use information ethically. These programs could be delivered through workshops, online tutorials, and one-on-one sessions, ensuring that students are equipped with the necessary skills to navigate an increasingly complex information landscape.

The study also revealed that there is a need for more education on copyright laws. Kamau (2018) explores the challenges faced by digital libraries, particularly around copyright issues, and emphasizes the need for educational programs that provide practical guidance on applying copyright laws in real-world situations. Given the increasing use of digital resources, it is essential for the library to offer training on copyright laws, focusing on how users can navigate issues related to digital rights, access restrictions, and proper attribution of sources.

In terms of enhancing library services, the study suggests the need for a comprehensive marketing strategy. As seen in the work of Gómez-Cruz, et al. (2020), effective marketing and communication are crucial for ensuring that users are aware of the resources available to them. The library should develop a social media presence, create an easy-to-navigate website, and produce visually appealing promotional materials that provide clear and concise information about its services. Regular surveys to collect user feedback should also be an integral part of the library's strategy, ensuring that services are continuously improved based on the evolving needs and preferences of users.

Finally, the study emphasizes the importance of staff development and training. As Delaney and Bates (2015) suggest, building strong faculty-librarian partnerships and fostering an environment of continuous professional development are key to providing effective library services. The library should offer training programs for staff on new technologies, user service skills, and emerging trends in library management. Collaboration with other departments on campus can also enhance the library's offerings, such as developing research guides for specific courses, organizing information literacy workshops, and collaborating on academic events. This multi-faceted approach will ensure that the library remains a valuable resource for the entire university community.

In conclusion, to meet the needs of its users and enhance satisfaction, the library must continue to evolve by embracing technological advancements, expanding its resources, extending access, and fostering continuous engagement with its user base. The findings of this study offer actionable insights that can guide the library's strategic planning and service development, ensuring that it remains a vital academic resource in the future.

8. Conclusion

The Maulana Azad Library has an integrated system that connects many internal/ departmental libraries, the libraries themselves doing many activities to promote the existing resources and their usage. The user training program also demonstrates many databases, ICT, and user manuals. Information literacy is a collection of essential responsibilities, with the necessity for information literacy being specifically defined. How to seek, evaluate, and utilize essential information effectively and efficiently without encountering any difficulties. Knowledge of information, its nature, and available formats; abilities to acquire the relevant information by sorting through the irrelevant; and attitude toward accessing and sharing information in accordance with acceptable standards and practices are all examples of Information Literacy. As a result of their lack of library usage skills, they require library staff support. When finding the information they need, they run into many issues. The feedback mechanics enhanced the library services and resources. They were unable to take advantage of e-resources to their full potential. The results reveal that people aren't aware of the value of using various search methods to obtain relevant information. Many users struggle with information literacy. To address this, organized sessions should be conducted on a quarterly basis to enhance users' awareness of available resources and services problem. The post-graduate students are reported to have a lower degree of information literacy skills than research scholars, followed by undergraduate and faculty members. Information literacy skills need to raise awareness about information literacy and its importance. This awareness can help individuals become self-sufficient in retaining and using information effectively. To help students improve their information literacy, it is recommended that orientation programs, workshops, and seminars be organized based on the needs of the students.

In conclusion, the study revealed that while users are generally aware of the library's resources and services, there is still room for improvement in accessibility, extended hours, and information literacy training. To address these areas and further enhance its services, the library should focus on incorporating more technology, developing a marketing strategy,

assessing user needs regularly, investing in staff development, partnering with other departments, staying up to date on trends, and conducting further research. By implementing these suggestions and pursuing continuous improvement, the Maulana Azad Library can elevate its position as a center of academic excellence at Aligarh Muslim University.
